

const newAbc = abc.bind(obj, ...fixedArgs);

(this will save abc in fn)

obj.fn = this

This newAbc → should be binded with obj

function(...nonfixed) {
 return obj.fn(...fixedargs,
 ...nonfixed)
}

Permanently
bind
fn with obj

→ function defi → ✓

→ context → ✓

→ newAbc() →
should be binded
with obj

bind \rightarrow it is a wrapper over
call or apply

internally bind works on the principle
of call & apply
